TC37x Pin Definition and Functions LFBGA-292 Package Pinning of TC37x TP

Note: Port Pins P32.0 and P32.1 are bidirectional pads and are having the following two functionalities implemented:

1. In case the pins are used as standard GPIOs the functions defined in the pin configuration tables of P32.0 and P32.1 are available.
2. In case the pins are used as pre-drivers for external MOSFETs (internal DCDC usecase) P32.0 and P32.1 act as analog IOs named VGATE1N and VGATE1P.

Note: Port Pins P32.0 and P32.1 are bidirectional pads and are having the following two functionalities implemented:

- In case the pins are used as standard GPIOs the functions defined in the pin configuration tables of P32.0 and P32.1 are available.
- In case the pins are used as pre-drivers for external MOSFETs (internal DCDC usecase) P32.0 and P32.1 act as analog IOs named VGATE1N and VGATE1P.

Whenever in table of section 3 'Electrical Specification' the term 'neighbor pads' is used, the detailed definition is provided by [Figure 2-36](#). This statement is also valid for next/nearest neighbor pads.

In order to find out who is affecting operation on a target pad (interfering) a number of active close-neighbor pads (ACNP) has to be defined.

Finding close-neighbor pads.

The Pad Ring has four edges: bottom, left, top, right. Each edge is limited, i.e. it has two ends.

Each pad has two direct (first) neighbors unless it is located at the end of the edge. In that case it only has one neighbor. Similarly, each pad has two indirect (second) neighbors unless it or its first neighbor is located at the end of the edge. These first and second neighbors we will collectively call Close-Neighbor pads. Therefore each pad has 2 to 4 close-neighbor pads.

Finding close-neighbors can be done with the following sequence:

- 1.) Choose a target pad and lookup its "X" and "Y" coordinates in table [Figure 2-36](#).
- 2.) Find first and second neighbors by calculating "X" and "Y" distance from the selected pad. [Figure 2-36](#) is sorted by "Y" coordinate, which might help locate the 4 close-neighbor candidates (if the pad is near the edge, it might end up with less than 4 close-neighbors).

Defining active pads:

Pad is active if it is currently in use and if it doesn't have "Vxx" in the name.

Figuring out number of active close-neighbor pads follow next rules:

- If the first neighbor is active, then we count it and also check if second neighbor (on the same side of selected pad) is active.
- If the first neighbor is not active, then we do not check the second on the same side.

3 Electrical Specification

3.1 Parameter Interpretation

The parameters listed in this section partly represent the characteristics of the TC37x and partly its requirements on the system. To aid interpreting the parameters easily when evaluating them for a design, they are marked with an two-letter abbreviation in column "Symbol":

- **CC**
Such parameters indicate **C**ontroller **C**haracteristics which are a distinctive feature of the TC37x and must be regarded for a system design.
- **SR**
Such parameters indicate **S**ystem **R**equirements which must be provided by the microcontroller system in which the TC37x designed in.

Electrical Specification Absolute Maximum Ratings

3.2 Absolute Maximum Ratings

Stresses above the values listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the Operational Conditions of this specification is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

Table 3-1 Absolute Maximum Ratings

Parameter	Symbol	Values			Unit	Note / Test Condition

Voltage at V_{DDP3} power supply pins with respect to V_{SS}	V_{DDP3} SR	-	-	4.43	V	
Voltage at V_{DDM} , V_{EXT} , V_{FLEX} and V_{EVRSB} power supply pins with respect to V_{SS}	V_{DDM} SR	-	-	6.75	V	upto 2.8h
		-	-	5.6	V	upto 72h
Voltage on all analog and class S input pins with respect to V_{SS} ³⁾	V_{IN} SR	-0.7	-	6.75	V	
Voltage on all other input pins with respect to V_{SS} ³⁾	V_{IN} SR	-0.7	-	6.75	V	
Input current on any pin during overload condition ^{4) 5)}	I_{IN} SR	-10	-	10	mA	
Absolute maximum sum of all input circuit currents during overload condition. ⁴⁾	ΣI_{IN} SR	-100	-	100	mA	

- 1) Valid for cumulated for up to 2.8h and pulse forms followed a power supply switch on phase, where the rise and fall times are related to the system capacities and coils.
- 2) Due to EVRC output voltage oscillation during switch off phase V_{DD} can drop down to -0.72V. For V_{DD} an input level down to -0.72V during switch off phase will not cause any damage or reliability problem.
- 3) Voltages below V_{INmin} have no impact to the device reliability as long as the times and currents defined in section Pin Reliability in Overload for the affected pad(s) are not violated.
- 4) This parameter is an Absolute Maximum Rating. Exposure to Absolute Maximum Ratings for extended periods of time may damage the device.
- 5) The specified min. and max. values represent the current limits, which have to be maintained, in case of a short circuit condition on the output of any Fast, RFast, Slow and Class S pad, not being used during operation. This covers also output currents due to switching in operation for $C_L=200\text{pF}$.

3.3 Pin Reliability in Overload

When receiving signals from higher voltage devices, low-voltage devices experience overload currents and voltages that go beyond their own IO power supplies specification.

The following table defines overload conditions that will not cause any negative reliability impact if all the following conditions are met:

- allowed time interval (defined in Note column) for overload condition is not exceeded. If no time limit is defined the allowed time includes both 'Operation Lifetime hours' and 'Inactive Lifetime hours'. The number of hours in [Table 3-67](#) and [Table 3-68](#) are examples only and the applicable numbers are defined by the customer profiles accepted by Infineon.
- **Operating Conditions** are met for
 - pad supply levels
 - temperature

If a pin current is out of the **Operating Conditions** but within the overload parameters, then the parameters functionality of this pin as stated in the Operating Conditions can no longer be guaranteed. Operation is still possible in most cases but with relaxed parameters.

This LVDS pad type is used for the high speed chip to chip communication interface of the new TC37x. It composes out of a LVDSH pad and a fast pad.

$C_L = 2.5$ pF for all LVDSH parameters.

3) Potential violations of the IEEE Std 1596.3 are intended for the new multislave support feature. To be compliant to IEEE Std 1596.3 LPCRx.VDIFFADJ has to be configured to 01.

4) Common Mode voltage of Tx is maintained.

Note: Driver ground potential difference is defined as driver-receiver potential difference, that can result in a voltage shift when comparing driver output voltage level and receiver input voltage level of a transmitted signal.

*Note: R_T in table 'LVDS - IEEE standard LVDS general purpose Link (GPL)' is as termination resistor of the receiver according to figure 3-5 in IEEE Std 1596.3-1996 and is represent in **Figure 3-1** either by RIN or by $RT=100Ohm$ but not both.*

3.7 VADC Parameters

The accuracy of the converter results depends on the reference voltage range. The parameters in the table below are valid for a reference voltage range of $(V_{AREF} - V_{AGND}) \geq 4.5 \text{ V}$. If the reference voltage range is below 4.5 V by a factor of k (e.g. 3.3 V), the accuracy parameters increase by a factor of $1.1/k$ (e.g. $1.1 \times 4.5 / 3.3 = 1.5$).

Noise on the voltage supply influences the conversion. The accuracy parameters are defined for a supply voltage ripple of below 20 mVpp up to 10 MHz (below 5 mVpp above 10 MHz).

Digital functions overlapping analog inputs influence accuracy.

The total unadjusted error (TUE) is defined without noise. The overall deviation depends on TUE and EN_{RMS} (depending on the noise distribution). Example: For a noise distribution of 4 sigma and $EN_{RMS} = 1.0$ the additional peak-peak noise error is 8 LSB.

Fast compare operations are executed with 10-bit values.

The noise reduction feature improves the result by adding additional conversion steps. The conversion times, therefore, increase accordingly ($4 \times t_{ADCI} + 3 \times t_{ADC}$ for each of 1, 3, or 7 steps).

- 1) These limits apply to the standard reference input as well as to the alternate reference input.
- 2) Parameter depends on reference voltage range and supply ripple, see introduction. Resulting worst case combined error is arithmetic combination of TUE and EN_{RMS} . Tests are done with postcalibration disabled, after completing the startup calibration.
- 3) Analog inputs mapped to pads of the type SLOW influence accuracy. The values for this parameter increase by 3 LSB₁₂.
- 4) Monotonic characteristic, no missing codes when calibrated.

- 7) For reduced reference voltages $V_{AREF} < 3.375V$, the consumed charge QCONV is reduced by the factor of $k2 = V_{AREF} [V] / 3.375$. For reduced reference voltages $4.5V < V_{AREF} \leq 3.375V$, QCONV is not reduced.

3.8 DSADC Parameters

The DSADC parameters are valid only for voltage range $4.5\text{ V} \leq V_{DDM} \leq 5.5\text{ V}$.

These parameters describe the product properties and do not include external circuitry. The values are valid for junction temperatures $T_J \leq 150^\circ\text{C}$ if not defined explicitly.

Calibration is specified for gain factors 1 and 2, calibrated values refer to these settings.

The signal-noise ratio (SNR) is specified for differential inputs. For single ended operation the resulting signal-noise ratio is reduced by 6 dB. For quasi-differential mode (i.e. using V_{CM}) its reduced by 3dB with gain=2 (6dB with gain=1).

1) t_{OSCS} is defined from the moment when the Oscillator Mode is set to External Crystal Mode until the oscillations reach an amplitude at XTAL1 of $0.3 * V_{EXT}$.

This value depends on the frequency of the used external crystal. For faster crystal frequencies this value decrease.

2) For Supply ($V_{EXT} < 5.3\text{V}$ V_{IX}) min could be down to -0.9V. For XTAL1 an input level down to -0.9V will not cause a damage or a reliability problem operating with an external crystal.

3) Square wave input signal for XTAL1.

Note: It is strongly recommended to measure the oscillation allowance (negative resistance) in the final target system (layout) to determine the optimal parameters for the oscillator operation. Please refer to the limits specified by the crystal or ceramic resonator supplier.

- 1) In QFP package for TC37xED emulation device, the total (IDDED + IDD) current need to be limited to 700 mA. The maximum (IDDED + IDD) current for TC37xED is supported only in BGA packages.
- 2) Limits are defined for real power pattern ($V_{DD} = 1.275V$). For max power pattern limit has to be multiplied by the factor 1.22.
- 3) Realistic Pflash read pattern with 50% Pflash bandwidth utilization and a code mix of 50% 0s and 50% 1s. A common decoupling capacitor of atleast 100nF for (V_{DDP3}) is used. Continuous Dflash programming in burst mode with 3.3 V supply and realistic Pflash read access in parallel. Erase currents of the corresponding flash modules are less than the respective programming currents at V_{DDP3} pin. Programming and erasing flash may generate transient current spikes of up to 45 mA / 20 ns which are handled by the decoupling and buffer capacitors. This parameter is relevant for external power supply dimensioning and not for thermal considerations.
- 4) Limits are defined for real power pattern. For ADAS power pattern limit sum up to 42mA.
- 5) The current consumption includes only minimal port activity.
- 6) Limits are defined for real power pattern. For ADAS power pattern limit has to be multiplied by the factor 0.7.
- 7) The total current drawn from external regulator is estimated with 72% EVRC SMPS regulator efficiency. IDDTOTDCx is calculated from IDDTOT using the scaled core current $[(IDD \times VDD)/(V_{in} \times Efficiency)]$ and constitutes all other rail currents and IDDM.

- 1) The current consumption includes basic HSM activity incl. AES module.
- 2) LBIST is executed either during start-up phase or can be triggered by application software. Secondary voltage monitors are inactive during the LBIST execution time (t_{LBIST}). During the start-up phase externally supplied V_{DD} voltage has to be equal or greater than 1.2V (V_{DD} nominal - 4%) for static accuracy. If V_{DD} is supplied internally by EVRC, EVRC takes care not to violate the V_{DD} 1.2V static under voltage limit.

3.12.1 Calculating the 1.25 V Current Consumption

The current consumption of the 1.25 V rail compose out of two parts:

- Static current consumption
- Dynamic current consumption

The static current consumption is related to the device temperature T_J and the dynamic current consumption depends of the configured clocking frequencies and the software application executed. These two parts needs to be added in order to get the rail current consumption.

$$I_0 = 3,974 \left[\frac{\text{mA}}{\text{C}} \right] \times e^{0,024 \times T_J[\text{C}]} \quad (3.1)$$

$$I_0 = 6,01 \left[\frac{\text{mA}}{\text{C}} \right] \times e^{0,024 \times T_J[\text{C}]} \quad (3.2)$$

Equation (3.1) defines the typical static current consumption and **Equation (3.2)** defines the maximum static current consumption. Both functions are valid for $V_{DD} = 1.275 \text{ V}$.

3.13 Power Supply Infrastructure and Supply Start-up

3.13.1 Supply Ramp-up and Ramp-down Behavior

Start-up slew rates for supply rails shall comply to SR (see [Table 3-33](#) Supply Ramp).

3.13.1.1 Single Supply mode (a)

Electrical Specification Power Supply Infrastructure and Supply Start-up

Figure 3-3 Single Supply mode (a) - VEXT (5 V) single supply

VEXT = 5 V single supply mode. VDD and VDDP3 are generated internally by the EVRC and EVR33 internal regulators.

- The rate at which current is drawn from the external regulator (dI_{EXT}/dt) is limited during the basic infrastructure and EVRx regulator start-up phase (T0 up to T2) to a maximum of 100 mA with 100 us settling time. Start-up slew rates for supply rails shall comply to datasheet parameter SR. The slope is defined as the maximal tangential slope between 0% to 100% voltage level. Actual waveform may not represent the specification.

Electrical Specification Power Supply Infrastructure and Supply Start-up

- Furthermore it is also ensured that the current drawn from the regulator (dI_{DD}/dt) is limited during the Firmware start-up phase (T3 up to T4) to a maximum of 100 mA with 100 μ s settling time.
- PORST is active/asserted when either PORST (input) or PORST (output) is active/asserted.
- PORST (input) active means that the reset is held active by external agents by pulling the PORST pin low. It is recommended to keep the PORST (input) asserted until the external supply is above the respective primary reset threshold.
- PORST (output) active means that μ C asserts the reset internally and drives the PORST pin low thus propagating the reset to external devices. The PORST (output) is asserted by the μ C when at least one among the three supply domains (VDD, VDDP3 or VEXT) violate their primary under-voltage reset thresholds. The PORST (output) is de-asserted by the μ C when all supplies are above their primary reset thresholds and the basic supply and clock infrastructure is available. During reset release at T3, the load jump of up to 150 mA (dI_{DD}) is expected.
- The power sequence as shown in [Figure 3-3](#) is enumerated below
 - T1 up to T2 refers to the period in time when basic supply and clock infrastructure components are available as the external supply ramps up. The bandgap and internal clock sources are started. The supply mode is evaluated based on the HWCFG[2:1,4,5,6] and TESTMODE pins. T1 up to T2 refers to the period in time when basic supply and clock infrastructure components are available as the external supply ramps up. The bandgap and internal clock sources are started. The supply mode is evaluated based on the HWCFG[2:1,6] pins. These events are initiated after LVD reset release at T1. LVD reset is released the both input voltages VEXT and VEVR33 are above VLVD RST5 and VLVD RST33 levels correspondingly. Internal pre-regulator VDDPD output voltage is above VLVD RSTC level.
 - T2 refers to the point in time where consequently a soft start of EVRC and EVR33 regulators are initiated. PORST (input) does not have any affect on EVR33 or EVRC output and regulators continue to generate the respective voltages though PORST is asserted and the device is in reset state. The generated voltage follows a soft ramp-up over the tSTR (datasheet parameter) time to avoid overshoots.
 - T3 refers to the point in time when all supplies are above their primary reset thresholds denoted by VRST5, VRST33 and VRSTC supply voltage levels. EVRC and EVR33 regulators have ramped up. PORST (output) is de-asserted and HWCFG[3:5] pins are latched on PORST rising edge by SCU. Firmware execution is initiated. The time between T1 and T3 is documented as tEVRstartup (datasheet parameter).
 - T4 refers to the point in time when Firmware execution is completed and User code execution starts with CPU0 at a default frequency of 100 MHz. The time between T0 and T4 is documented as tBP (datasheet parameter).
 - T5 refers to the point in time during the ramp-down phase when at least one of the externally provided or generated supplies (VDD, VDDP3 or VEXT) drop below their respective primary under-voltage reset thresholds.

- 2) Cold PORST reset is driven by uC and maintained in an extended voltage range between VDDPPA limit and absolute maximum rating voltage limits.

This mechanism helps to avoid multiple consecutive cold PORST events during slow supply ramp-ups owing to voltage drop/current jumps when reset is released.

Table 3-32 Supply Monitors (cont'd)

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Primary undervoltage reset threshold for V_{EXT} before trimming	$V_{RST5\ CC}$	-	-	3.0	V	by last cold PORST release on supply ramp-up including voltage hysteresis.
EVR secondary monitor measurement latency for all 6 supply rails	$t_{MON\ CC}$	-	-	3.2	μ s	HPOSC and SHPBG bandgap trimmed. Filter inactive.

- 1) The reset release on supply ramp-up is delayed by a time duration 20-40 μ s after reaching undervoltage reset threshold and by a voltage hysteresis of 1.5% above the undervoltage reset limit. These mechanisms serve as hysteresis to avoid multiple consecutive cold PORST events during slow supply ramp-ups owing to voltage drop/current jumps when reset is released. The reset limit of 2.97V at pin is for the case with 3.3V generated internally from EVR33. In case the 3.3V supply is provided externally, the bondwire drop will cause a reset at a higher voltage of 3.0V at the VDDP3 pin.
- 2) The monitor tolerances constitute the inherent variation of the band gap and ADC over process, voltage and temperature operational ranges. The $V_{xxPRIUV}$ parameters are device individually tested in production with +/-1% tolerance about the $V_{xxPRIUV}$ limits. All voltages are measured on pins.
- 3) $VRST_{xx}$ parameters are relevant only for the first cold PORST release. Later the reset levels are trimmed by the Firmware and reflected as $V_{xxPRIUV}$ parameters before device is used with full performance. The cold PORST is released with a voltage hysteresis on all the primary monitors to avoid consecutive PORST toggling behavior.
- 4) In case the application is using 3.3V single supply (Single Supply mode (e), i.e. V_{EXT} and VDDP3 are shorted together), it is recommended to use secondary supply monitoring on channel VDDP3, because of the better accuracy of parameter VDDP3MON.
- 5) To monitor voltage level not provided in conditions the values for OV and UV thresholds can be generated by a linear interpolation or extrapolation based on the given points.

Table 3-33 Supply Ramp

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
External V_{EXT} & V_{EVRSB} supply ramp-up and ramp-down slope 1) 2) 3)	dV_{EXT}/dt SR	8.3E-6	1	100	V/ms

External V_{DD} supply ramp-up and ramp-down slope ¹⁾³⁾	dV_{DD}/dt SR	8.3E-6	1	100	V/ms	
External V_{DDM} supply ramp-up and ramp-down slope ¹⁾³⁾	dV_{DDM}/dt SR	8.3E-6	1	100	V/ms	

- 1) The device is robust against residual voltage ramp-up starting between 0 - 2.97 V for V_{EXT} , V_{EVRSB} , VDDP3 and VDDM and 0-1 V for VDD. A voltage ramp range between 0.5V/min upto 120V/ms is covered in robustness validation.
 - 2) Also valid in case EVR33 or EVRC is used. The generated voltage itself follows a soft ramp-up over the t_{STR} time to avoid overshoots.
 - 3) The slope is defined as the maximal tangential slope between 0% to 100% voltage level. Actual waveform may not represent the specification.
- Up to 1000000 power-cycles, matching the limits defined in the table 'Supply Ramp' are allowed for TC37x without any restriction to reliability.

Electrical Specification Package Outline

- 1) The top and bottom thermal resistances between the case and the ambient (RTH_CTA, RTH_CBA) are to be combined with the thermal resistances between the junction and the case given above (RTH_JCT, RTH_JCB), in order to calculate the total thermal resistance between the junction and the ambient (RTH_JA). The thermal resistances between the case and the ambient (RTH_CTA, RTH_CBA) depend on the external system (PCB, case) characteristics and are under user responsibility.

The junction temperature can be calculated using the following equation: $T_J = T_A + RTH_JA * P_D$, where the RTH_JA is the total thermal resistance between the junction and the ambient.

Thermal resistances as measured by the 'cold plate method' (MIL SPEC-883 Method 1012.1).
